

# Ultra-Pure, Sterile Filtration for Laboratories

Many Laboratories and Dental offices need ultra pure water for testing, compound blending and equipment sterilization.

Until now many have had to purchase expensive distilled water in plastic bottles that need to be delivered, are bulky and have to be stored, taking up precious space in your office or lab.

TMWS provides you with the perfect solution, we use Reverse Osmosis filtration to pre-treat the water and remove 95% of the Total Dissolved Solids (TDS).

This is considered Ultra Pure water very close to distilled water but we don't stop there. We then use Deionization (DI) to remove all the minerals and create laboratory-rated purity water.

We can install an auxiliary Pure Water faucet to fill bottles or feed the water to any other specific application that you have.

We test the water regularly and have a service sticker to record the test results.

If you require daily testing or in-line metering, we can provide that equipment as well.

*TMWS can design a custom system specific to your needs!*
